According to the Manual pics it looks like the locking levers are in the wrong position pics. We tried moving them but they appear to be stuck and didnt want to force them unless we had to. Are we doing something wrong trying to get the locking levers up, or should we continue to force them. Any particular tool. Were renting and this happened once before when cooking about 6 months ago and the Real Estate got a Handyman to come out. The Handyman fixed it in about 510 mins I didnt see it and said that this is a common issue with the Bosch ovens but easy to fix. We spoke to the Real Estate again but this time they want to charge us, so were hoping that someone on Reddit knows how to fix this easily so we can save some cash.

<http://www.drupalitalia.org/node/72882>

Also, the guy didnt say it was specifically the locking levers that were the issue, Im just thinking it is because their positions seem wrong according to the manual. It could be something else perhaps. Thanks, Zui Like Share More 1 answer Bosch H. Bosch Home Appliances 1 year ago Hi zuirey8, Thanks for the question regarding your Bosch oven. When refitting the door, check that both hinges are positioned exactly inside their respective openings. The bottom groove of the hinges must fit snugly on both sides. The door may be left crooked if the hinges are not mounted properly. Reclose the attachment levers. Then you should be able to close the oven door. This process can be found in page 11 of the user manual along with images to assist with the process. However if you would like to speak to someone, feel free to contact us on 1300 369 744. Our oven symbols guide will help make sure you use the right setting to crisp your pizza base or bake your biscuits. We also explain some of the other features you'll find on your built-in oven's control panel. Related Unexpected results in the kitchen. Find out why an inaccurate oven may be to blame. Lower heat element only A single horizontal line at the bottom of a square means that heat will come solely from the heating element at the bottom of the oven. The fan won't be used to circulate the heat. This setting is great for gently cooking stews and casseroles.

It's also a good option for crisping up the base of a pizza or pastry case. Upper and lower heating elements Two horizontal lines at the top and bottom of a square show that heat will be generated by elements in the top and bottom of the oven. This is a good option for single-shelf cooking of pastries or scones, or something substantial such as a large fruit cake. This setting also works well for roasting meat. Fan with lower heat A single horizontal line at the bottom of the square with a fan above it indicates that heat will be produced at the base but will be wafted around by the fan. This is great for keeping the top of a dish moist while the bottom gets nicely cooked. It's a good option if you want to avoid the need for blind baking pastry on pies and quiches, and also works well for crispy pizzas. Fan oven A fan surrounded by a circle represents an oven fan with its own heating element. Heat comes from a circular element surrounding the fan at the back of the oven and the fan then circulates this heat around. Good fan ovens will spread heat evenly, so whether you're cooking near the top, bottom, back or front you should get similar results. If your oven's heat distribution is poor, you may have to move your trays around to get even cooking results. A fan symbol on its own, or with horizontal lines above and below it, shows that the fan is spreading heat from the upper and lower heating elements, rather than from the back. Fans are good for most types of cooking, particularly when you're using more than one shelf. They also work well for roasting meat, where you want the meat to be tender on the inside and well done on the outside. Full grill A double zigzag line at the top of the symbol box means that heat is being produced by the whole grill element. Some grills are designed to be used with the door closed, while some need the door to be open, so check what your oven's manual recommends.

Good grills will make sure that all your food gets crisped or browned evenly, whereas poor grills will give patchy results. If you use the full grill, you'll be able to cook a lot of food at once it's a good choice for anything that sizzles, such as sausages and bacon. It can be handy for browning off meat, the top of a lasagne or for making a large round of toast. Part grill For half-grill settings, only one section of the grill element gets hot, so remember to make sure your food is directly under this part of the grill. Having the option to use half the grill is handy if you only want to cook a couple of sausages or brown a slice of cheese on toast. Grills are a good choice for anything that sizzles, such as bacon and sausages, or for the last few minutes of cooking dishes topped with cheese or breadcrumbs that need to be browned. Grill and fan A zigzag line at the top with a fan below means that the grill and fan is on at the same time. The fan spreads the grill's heat, making it less fierce. This means it's good for cooking through thicker pieces of meat or fish without heating up the whole oven or burning the top. Grill and lower heat A zigzag line at the top and a horizontal line at the bottom shows that the grill is being used in combination with the lower heating element. This is a good option for pies, tarts or pizzas that need a crispy base and a browned surface. Defrost Some ovens have a defrost setting, represented by a snowflake with a water droplet emerging from it. This means that the fan is on but no heat is produced, so no cooking takes place. The moving air defrosts

food much more quickly than simply leaving it on the kitchen table a handy feature if you're in a hurry to defrost some meat for dinner, for example. **Oven light** Your oven may have a separate light setting, meaning you can turn it on when the oven isn't in use this makes it easier to spot grime when giving it a clean. With some ovens, the light comes on only when the oven is in use.

**Plate warming** Three lines on top of each other represents the platewarming function. This gently warms plates or other dishes to prevent food from cooling too quickly when served. **Pyrolytic cleaning** There are lots of ovens available now that offer high-temperature pyrolytic cleaning. You are then left with the straightforward job of wiping off the ash that's left behind. As pyrolytic cleaning hasn't been mainstream for long, the symbols used by manufacturers aren't consistent, but examples include a capital P, or a series of dots or diamond shapes that increase in size. **Alarm** This does what it says on the tin. Set the alarm for your chosen time and you'll be alerted by buzzing or beeping when it's time to check if your food is cooked. **Minute minder** A minute minder will turn off the oven automatically after a certain amount of time has passed. Just turn on the oven, put your food in and set the time you want it to cook for. The minute minder will switch the oven off once the time is up and also give an audible beep or buzz. **Child lock** These are more commonly found on hobs, but you do sometimes get a childlock option on ovens, too. They generally work by pressing and holding a touch control for a few seconds to activate or deactivate the child lock. When the child lock is on, the oven will not respond to buttons being pressed or dials being turned.
